Render controls

Lasershow Converter FLASH will automatically render the scene when you load an SWF file for the first time. However, it may be necessary to re-render the scene or part of the scene as you make changes to the default render settings or to one of the object settings.

Lasershow Converter FLASH allows you to render only the current frame, only a block of frames, or the entire scene. Rendering is initiated by pressing one of the Render buttons on the toolbar.

img	Render the current frame	**Renders only the current frame** that is selected by the Frame Slider.
img	Render all frames	**Renders all frames** in the FLASH file.
img	Render block of frames	**Renders the block of frames** specified in the From and To text boxes.
