# Timeline marker import, export

Import

BEYOND can import Timeline markers from various applications if they are in the right file format.

The file format initially designed by Reaper software is adopted by multiple applications. BEYOND will also allow you to import and export time marker files.
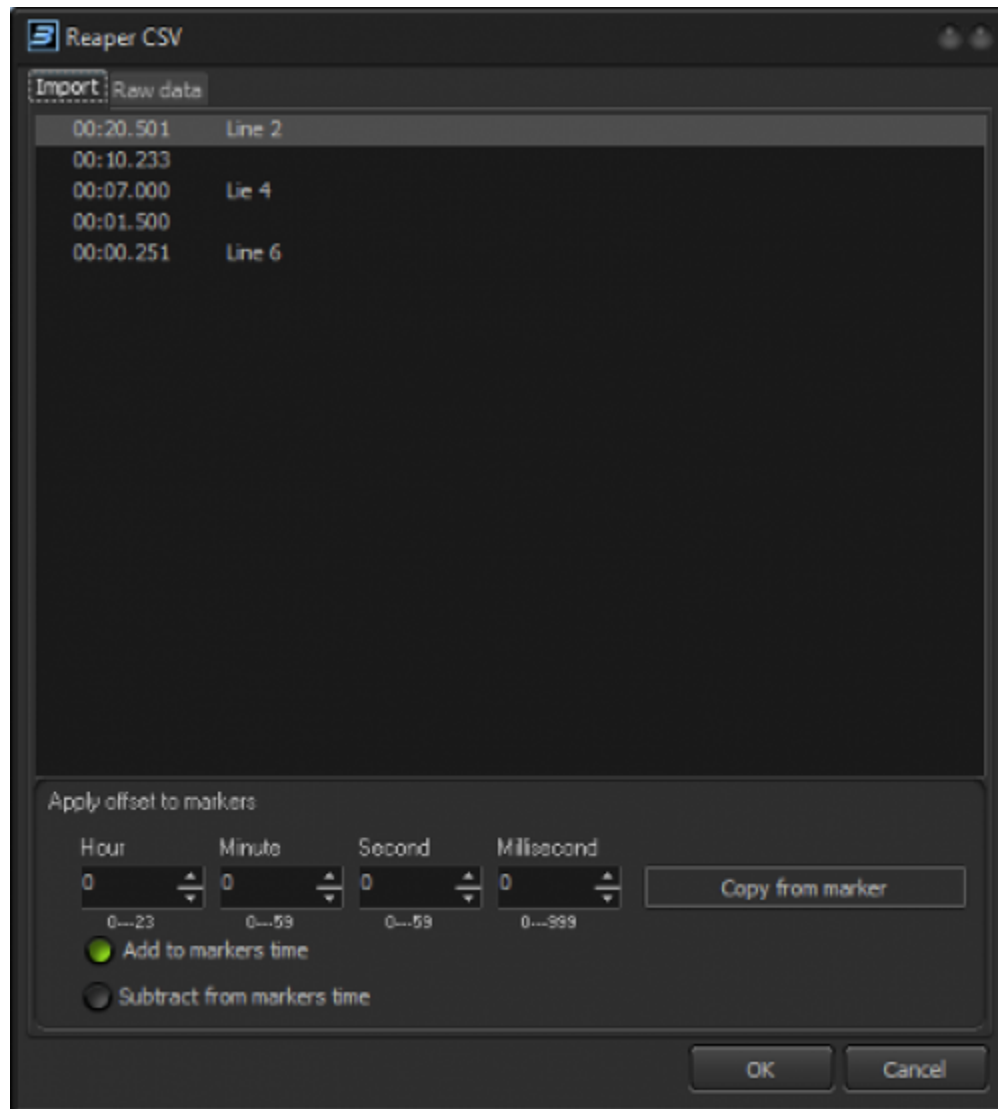

To start the import, open up the timeline editor in BEYOND , Click File » Import markers. Note that the markers will be placed on the timeline that is currently active.

After starting the import,the Raw data tab will display the content of the file. The file it self is a comma separated file. The first line contains the names of the columns.

BEYOND accepts Start, Name and Color fields.

```
Reaper CSV

Import  Raw data

#,Name,Start,End,Length
M5,Line 2,0:20.501,,
M4,,0:10.233,,
M3,Lie 4,0:07.000,,
M2,,0:01.500,,
M1,Line 6,0:00.251,,
```

OK   Cancel

The Import tab will show a view of all the imported values. If BEYOND detect an incompatible syntax than then list will be empty.

Often reaper CSV files may have markers which start from high time offsets. "Apply offset to markers" allows you to compensate for these high time offsets by using the Add or Subtract options.

As soon as markers are imported and you see these in the list, click OK, and BEYOND will complete the generation of the timelime markers. BEYOND will also adjust the viewing area of the active timeline to display all marks.

Note that a mark will be ignored if the timeline already contains a marker on that specified time.

Export

To start the export, open up the timeline editor in BEYOND , Click File » Export markers. BEYOND will ask you where to store the CSV file. The exported file is in the same file format initially designed by Reaper software.
