

# Renderer: Line Types

The default line types that are selected when you create a new scene with Lasershow Converter MAX are:

- **Silhouette + Folds**
- **Crease**
- **Surface Intersections with other objects**

These line types will work for most scenes. However, there will be times when you need a different combination of line types. You can check as few or as many as you like, to get your desired results.

The sections below demonstrate the line types, and some combinations of line types.

## Silhouette

Creates a line that surrounds the boundary of the object, from the current viewpoint.

## Silhouette + Folds

Creates a line the surrounds the boundary of the object, and also creates any lines as a result of folds in the object.

## Creases

Creates a line where two adjacent faces don't share the same Smoothing Group. Notice how the cube has clear creases in its surface, but how the sphere does not. This is controlled by Smoothing Groups in 3ds Max. If the object has creases that are clearly visible in 3ds Max, the **Creases** option will create a line on this part of the object. Generally, only rectangular objects have creases.

## Surface Intersections with other objects

Creates a line where two objects intersect. This can be seen with the two cubes below. If **Surface Intersections with other object** is enabled, this creates a line where the two surfaces intersect. This is one area where Lasershow Converter MAX is superior to systems that only do hidden-line removal. This system is capable of not only hiding hidden-lines, but also producing lines where two objects intersect, which gives a far more realistic 3D appearance.

-------------------------	--------------------------------------	---

## Surface Intersections within the same object

This is similar to the option above, but this option creates lines where two surfaces within the same object intersect. Not too many objects are like this, but the teapot shown below is one such object.

Since not too many objects have self-intersecting surfaces, this option is turned off by default to save calculation time.

## Material Change

Creates a line where there is a material change within an object. Usually, objects have only one material assigned to them. But it is possible to assign multiple materials to the same object.

## MAX-defined

Creates a line where an edge in the mesh is defined as Visible by 3ds Max. You can make an edge visible or invisible in MAX by using the menu **Edit Mesh/Edge/Visible** or **Invisible**. For additional information about MAX-defined, see the [Tips: Using MAX-defined](#) topic.

**MAX-defined**

## All polygon lines

Creates a line anywhere that a polygon edge exists. Note that this is different from MAX-defined in that this will create a line on all polygon edges, regardless of whether or not the edge is defined as Visible by 3ds Max.

**MAX-defined****All polygon lines**

## Contours

Creates lines that run across the surface of an object. These lines are of a constant height increment. The number of contours is controlled by the spinner and text box beside the Contours option.

Within the [Object line types](#) panel you have the option of specifying which direction (which axis) the contour lines run.
