

How to use the Timeline Show Playlist within BEYOND

Play List

The Play List is specifically designed for playing Timeline shows. It is not possible to load all shows into the Workspace memory. Please save your Timeline shows into BEYOND Show files. The Play List has the ability to "Preload" shows, so BEYOND will keep the show in memory.

Toolbar buttons

Add - adds one or multiple shows to the play list.

Play - plays the currently selected show.

Stop - stop the playback of the currently playing.

Video - shows/hides the Video window, it is required for multimedia shows.

Loop - plays the show list in a loop.

First - Goes to 1st show in the list.

Previous - Goes to previous show in the list.

Next - Goes to next show in the list.

Last - Goes to last show in the list.

Show It Now - enables laser output of Play List.

Time panel

The left side (green) - the amount of time that has passed since the show beginning.

The center (yellow) - visible when the mouse cursor is above the time slider (progress bar) and shows the time corresponding to the cursor position.

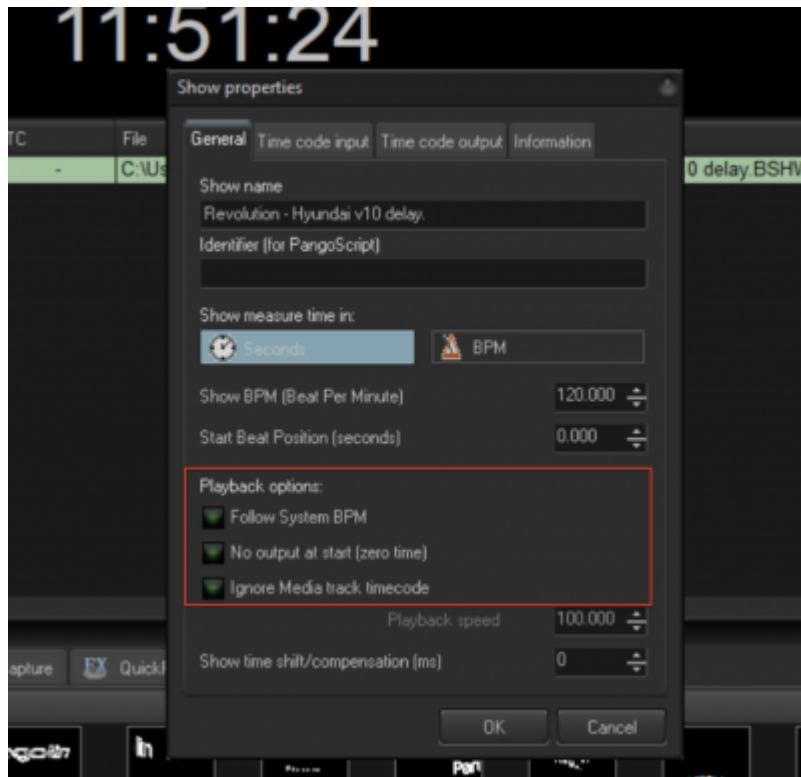

The right side (green) - the amount of time before the end of the show.

Time slider (progress bar) - visible while the show is active and also can work as a slider. You can click on it and the show playback will jump to corresponding position.

File list

BEYOND plays all Show files in the list sequentially. For time critical situations you can preload the show into memory by means of the Preload flag available in the context menu together with a few other standard commands.

Show properties

Follow System BPM - Overwrites show BPM and forces usage of BPM from the Grid mode toolbar (main system BPM)

No Output at start - Only when a show is driven by timecode, and is waiting on position 0, do not generate output to laser, even if show events starts from position 0.

Ignore media track timecode - The show will not use audio/video events timecode information even if such events exists on timeline.

A Couple of hints:

There are PangoScript commands that work with the Play List . If you need a more complex scenario than a linear execution, please take a look at PangoScript.

During the Play List playback, you can use the Workspace Grid at the bottom of the BEYOND interface as well as the Live Control tab.
